

## Deployment 6

### Screenshot of a successful and a failed test

### Here Be Dragons:

1. "/home/ec2-user/jenkins" became "/home/ubuntu/jenkins/app"
2. Bootstrap script was useless, I had to reinstall the scripts manually
3. Forgot to chmod the pem file
4. Ssh -i file.pem ec2-user@0.0.0.0 became ssh -i file.pem ubuntu@0.0.0.0
5. Jenkins configurations: agent hosts is the private IP address and you have to click non-verifying strategy or else

### Things I Did Differently:

I added an "&" to the Jenkinsfile so it can build in the background. This addition also saves a lot of time. [serve -s build &]

I was able to find the screenshots and video of the cypress tests by using the command: "find /home -name \*.mp4". Then, I copied and moved the screenshots and video to my home directory and moved them again to my repo. From the repo, I SSH'd and pushed the files into my github account.
